NEWS RELEASE

KEX2008-08

Flagstaff, WA Property: Drill Results Upgrade

Kent Exploration Inc, (the “Company”), corrects the previously reported assay results that have been received on two of six holes from its fall 2007 diamond drill program, as described in NR KEX2008-7..

Assay results were quoted as “Barite” ($BaSO_4$) instead of Barium Oxide (BaO).

The ME-XRF06 assay procedure used by ALS Chemex converts the “Barite” contained in the core to Barium Oxide (BaO) and was reported as BaO . To calculate the “Barite” content, the BaO must be multiplied by a factor of 1.52211.

As reported, DDH FLAG07-01 was drilled between CE Minerals drill hole CE53 and CE54 and intersected 84 feet from 41 feet to 125 feet grading an average of 51.15% BaO , which is 77.9% barite.

FLAG07-03 was drilled in the approximate location of CE Minerals drill hole CE53 and intersected 14.5 feet of barite from 35.5 feet to 50 feet grading 51.42% BaO (78.3% barite), 49 feet from 57 feet to 105 feet grading 54.66% BaO (83.2% barite), 7 feet from 108 feet to 115 feet grading 56.53% BaO (86.0% barite), and 19 feet from 116 feet to 135 feet grading 62.89% BaO (95.7% barite).

Kent Exploration Inc is a junior exploration company that has a 100% interest in a mining lease option on a gold/silver/barite prospect in eastern Washington state, is earning a 100% interest in the Rosebud property, a gold/silver prospect in northern Arizona, and has earned a 50% interest in the Ivanhoe Creek property, a Midas-style target containing a bentonite deposit in Nevada’s Carlin Trend.

This News Release has been prepared on behalf of the Kent Exploration Inc Board of Directors, which accepts full responsibility for its contents. The contents of this release have been reviewed and approved by Marvin A. Mitchell, P. Eng., a qualified person as defined by National Instrument NI-43-101.
